ABSTRACT FOR HH-0001-2007

ACUTE EYE IRRITATION TEST OF F10 SUPERCONCENTRATE (Batch no:071202)

Experimental Starting Date: 05 Mar 2007
Experimental Completion Date: 18 Mar 2007

The test system was in accordance with the OPPTS 870.2400: Acute Eye Irritation Standards.

Three adult female albino rabbits, weighing approximately one kilogram, (New Zealand White strain) were used for the eye irritation test.

The test substance was placed in the conjunctival sac of the right eye of all six test animals after gently pulling the lower lid away from the eyeball by using a micropipette with tip. The lids were then gently held together for about one second in order to limit loss of the test material. The left eye, which remained untreated, served as the control. The eyes of three test animals (group1) were washed out using 5 ml of dH₂O after 30 seconds, and the eye of the remaining three test animals (group 2) were washed out after 2 min.

The results shows that after the eyes were washed out using 5 ml dH₂O after instillation of the test item, after 30 seconds as well as 2 min after application of the test item to the eyes, the symptoms were still moderate to severe. Mostly the symptoms became worse up until 6 days after application of the test item. Reversibility/irreversibility could not be determined due to termination of the study by the veterinarian after 7 days due to severe irritation of the eyes of all animals.

According to EPA Toxicity Categories this falls within category I.

A handwritten signature in black ink, appearing to read 'D J Goosen', is written over a horizontal line.

Dr D J Goosen (BVSc Hons) (Signed electronically)

Acute Toxicity Categories for Pesticide Products

Hazard Indicators	I	II	III	IV
Eye irritation.....	Corrosive; corneal opacity not reversible within 7 days	Corneal opacity reversible within 7 days; irritation persisting for 7 days	No corneal opacity; irritation reversible within 7 days	No irritation
