ABSTRACT FOR HH-02/10/06

ACUTE DERMAL IRRITATION TEST OF F10 DISINFECTANT INSECTICIDE SPRAY (Batch no:B/n 282)

Experimental Starting Date: 17 Oct 2006
Experimental Completion Date: 31 Oct 2006

The test system was in accordance with the OPPTS 870.2500: Acute Dermal Irritation Standards.

Three healthy adult Duncan Hartly Guinea Pigs were used during this study.

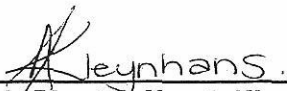

It was expected that the test substance will not produce severe irritancy or corrosion, therefore the test was started using three animals, each receiving one patch for an exposure period of 4 hours.

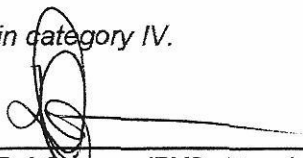

No corrosive effect was observed after 4 hours.

After removal of the patches, very slight erythema was observed in animal number 2 and 3. These two animals however showed no symptoms after the 24 hour observation and then throughout the study. Animal 1 showed no symptoms during the study at all. The control regions on the animals (where no test substance was added) showed no symptoms of either erythema or edema.

It is therefore concluded that the F10 disinfectant insecticide spray may cause dermal irritation (erythema) for a few hours, but that the effect is reversible within 24 hours.

According to EPA Toxicity Categories this falls within category IV.

Study Director: Mrs. A. Kleynhans (MSc)

Dr D J Goosen (BVSc Hons)

Acute Toxicity Categories for Pesticide Products

Hazard Indicators	I	II	III	IV
Skin irritation.....	Corrosive at 72 hours	Severe irritation irritation at 72 hours	Moderate irritation at 72 hours	Mild or slight
